Drawing circles and
more

Drawing a circle

Implicit equation

$$x^2 + y^2 = R^2$$

“Functional” equation
(multi-valued)

$$y = \pm\sqrt{x^2 + R^2}$$

Circle with trig

Parametric equation

$$x = R \cos(t)$$

$$y = R \sin(t)$$

$$0 \leq t \leq ??$$

Circle with trig

Parametric equation

$$x = R \cos(t)$$

$$y = R \sin(t)$$

$$0 \leq t \leq 2\pi$$

Validating parametric equations

Substitute parametric
into implicit

$$x = R \cos(t)$$

$$y = R \sin(t)$$

$$(R \cos(t))^2 + (R \sin(t))^2 = R^2$$

$$R^2(\cos^2(t) + \sin^2(t)) = R^2$$

$$R^2(1) = R^2$$

Inside or outside?

Implicit equation

$$x^2 + y^2 = R^2$$

Inside or outside?

Implicit equation

$$x^2 + y^2 = R^2$$

$$x^2 + y^2 > R^2 \quad \text{out}$$

$$x^2 + y^2 < R^2 \quad \text{in}$$

Summary of curve equations

- Implicit $f(x,y) = 0$
 - Inside/Outside tests
- Parametric $x = f_x(t)$ $y = f_y(t)$
 - Drawing/Intersection tests
- Functional $y = f(x)$
 - Dual purpose: drawing, testing

Coding parametric curves

Circle

```
for t = 0 to 2π by step 0.1  
    x = R*cos(t)  
    y = R*sin(t)  
    putpixel(x,y)
```

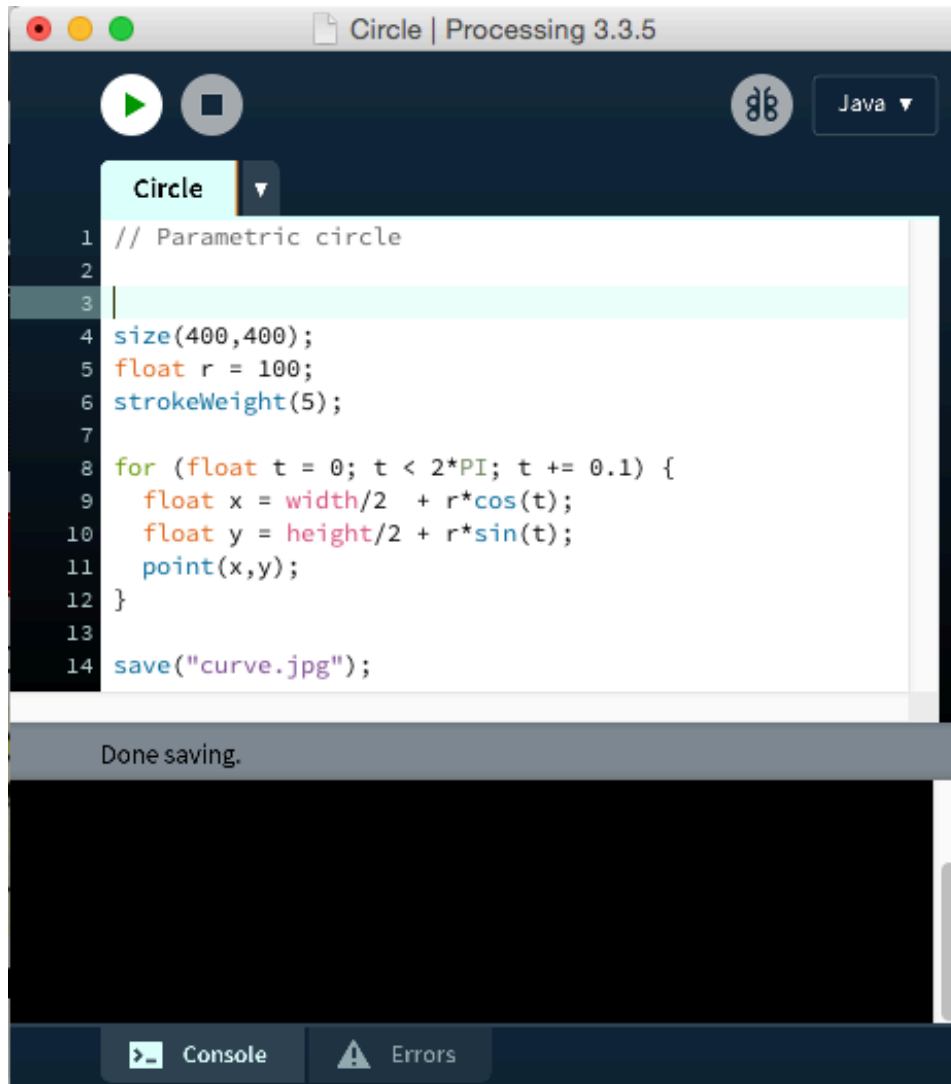

Generic

given

$$x = f_x(t)$$

$$y = f_y(t)$$

```
for t = t0 to t1 by step dt  
    x = fx(t)  
    y = fy(t)  
    putpixel(x,y)
```

The screenshot shows the Processing IDE interface. The title bar reads "Circle | Processing 3.3.5". The top toolbar contains a play button, a stop button, and a language dropdown set to "Java". The code editor displays the following code:

```
1 // Parametric circle
2
3
4 size(400,400);
5 float r = 100;
6 strokeWeight(5);
7
8 for (float t = 0; t < 2*PI; t += 0.1) {
9   float x = width/2 + r*cos(t);
10  float y = height/2 + r*sin(t);
11  point(x,y);
12 }
13
14 save("curve.jpg");
```

Below the code editor, a status bar indicates "Done saving.". At the bottom, there are tabs for "Console" and "Errors".

```
size(400,400);  
float r = 100;  
strokeWeight(5); // Set point size in pixels  
  
for (float t = 0; t < 2*PI; t += 0.1) {  
    float x = width/2 + r*cos(t);  
    float y = height/2 + r*sin(t);  
    point(x,y);  
}  
  
save("curve.jpg");
```

Playing with the code ...

```
for (float t = 0; t < 2*PI; t += 0.3) { // Change increment
```

```
for (float t = 0; t < PI; t += 0.3) { // Change limits
```

```
float x = width/2 + 1.5*r*cos(t); // Unequal r  
float y = height/2 + r*sin(t);
```

```
float x = width/2 + 10*t*cos(t); // Varying r  
float y = height/2 + 10*t*sin(t);
```

```
strokeWeight(random(1,10)); // Random point size  
point(x,y);
```

Next steps

- Animate
- Collect more parametric curves
 - Cartesian
 - Polar

- Add third dimension

- Move to surfaces

Animate

```
// Infinity Rainbow
// from Jason Labbe (jasonlabbe3d.com)
void setup() {
    size(600,600);
    colorMode(HSB,255); // Hue/Saturation/Brightness
    background(255);
    noStroke();
}

void draw() {
    fill(frameCount % 255,255,255);
    float x = (width/2)+100*sin(frameCount/20.0);
    float y = (height/2)+200*sin(frameCount/10.0);
    ellipse(x,y,20,20);
}
```

Superellipses

Generalized ellipse that can take different shapes based on exponent n

$$|x|^n + |y|^n = R^2$$

$$x = R \cos^{\frac{2}{n}}(t) \operatorname{sgn}(\cos(t))$$

$$y = R \sin^{\frac{2}{n}}(t) \operatorname{sgn}(\sin(t))$$

SUPER-ELLIPSOID

SHELL PARAMETERS

What you should know

1. How to draw circles and more with parametric equations
2. Using powers of fractions to bias curves
3. Using parametric equations for curves, shapes, animations and other purposes
4. How to play with a parametric curve to get variations and randomness
