Shading

GLSL Basics

GLSL Basics

uniforms, textures

You give meaning to any in attributes and out variables (except gl_Position and the final color going to the screen) as well as uniforms and 'textures'.

Vertex **in** Attribute examples: normals, colors, vertex-positions, uv etc. [read-only]

out vs -> ps examples: normals, colors, vertexpositions, uv, etc. [interpolated perspective-correctly, write-only]

uniform: properties of lightsources, transformation-matrices etc. [aka. constants]

GLSL

vertex shader

```
uniform sampler2D myTexture;
in float ndotl;
in vec2 frag_texcoord;
out vec4 frag_shaded;
void main()
{
    frag_shaded = ndotl * texture(myTexture, frag_texcoord);
}
```

GLSL

vertex shader

```
uniform mat4 projection;
uniform mat4 modelview;
uniform vec4 lightDirection;

in vec3 normal;
in vec4 position;
in vec2 texcoord;

out float ndotl;
out vec2 frag_texcoord;

void main()
{
    ndotl =
        max(dot(modelview * vec4(normal,0), lightDirection),0);
    frag_texcoord = texcoord;

    gl_Position = projection * modelview * position;
}
```

```
uniform sampler2D myTexture;
in float ndotl;
in vec2 frag_texcoord;
out vec4 frag_shaded;
void main()
{
    frag_shaded = ndotl * texture(myTexture, frag_texcoord);
}
```

GLSL

vertex shader

```
uniform mat4 projection;
uniform mat4 modelview;
uniform vec4 lightDirection;

in vec3 normal;
in vec4 position;
in vec2 texcoord;

out float ndotl;
out vec2 frag_texcoord;

void main()
{
    ndotl =
        max(dot(modelview * vec4(normal,0), lightDirection),0);
    frag_texcoord = texcoord;

    gl_Position = projection * modelview * position;
}
```

```
uniform sampler2D myTexture;
in float ndotl;
in vec2 frag_texcoord;
out vec4 frag_shaded;

void main()
{
    frag_shaded = ndotl * texture(myTexture, frag_texcoord);
}
```

int, float, bool as in C/C++

vec2, vec3, vec4:

vectors of float elements

Addition is vector addition (no .add() call needed!), multiplication with matrices with just *.

vec2, vec3, vec4:

support **swizzling**: Direct access to x,y,z,w-components possible *in any order* by using point-operator "."

```
Example:

vec4 myVec = vec4(1,2,3,4);

myVec.x

-> 1

myVec.xy
-> (1,2)

myVec.yx
-> (2,1)

myVec.zzz
-> (3,3,3)

myVec.wwxy
-> (4,4,1,2)
```

This can do more than attribute-access in most programming languages!

mat3, mat4:

Float-matrices of size 3x3 or 4x4

Access on specific element possible with double brackets "[][]" Access on specific row possible with single bracket "[]"

mat3, mat4:

Float-matrices of size 3x3 or 4x4

Access on specific element possible with double brackets "[][]" Access on specific row possible with single bracket "[]"

sampler2D:

Identifier for 2D-texture

Used to fetch data from texture via texture()

...more on this later...

diffuse shading with texture for one directional light

vertex shader

```
uniform sampler2D myTexture;
in float ndotl;
in vec2 frag_texcoord;
out vec4 frag_shaded;
void main()
{
   frag_shaded = ndotl * texture(myTexture, frag_texcoord);
}
```

diffuse shading with texture for directional light

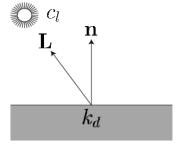

vertex shader

```
uniform sampler2D myTexture;
in float ndotl;
in vec2 frag_texcoord;
out vec4 frag_shaded;
void main()
{
    frag_shaded = ndotl * texture(myTexture, frag_texcoord);
}
```

diffuse shading with texture for directional light

vertex shader

```
uniform sampler2D myTexture;
in float ndotl;
in vec2 frag_texcoord;
out vec4 frag_shaded;
void main()
{
    frag_shaded = ndotl * texture(myTexture, frag_texcoord);
}
```

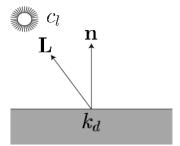

diffuse shading with texture for directional light

vertex shader

fragment shader

```
uniform sampler2D myTexture;
in float ndotl;
in vec2 frag_texcoord;
out vec4 frag_shaded;
void main()
{
    frag_shaded = ndotl * texture(myTexture, frag_texcoord);
}
```

Important:

L and n have to be in the same coordinate system!

diffuse shading with texture for directional light

vertex shader

fragment shader

```
uniform sampler2D myTexture;
in float ndotl;
in vec2 frag_texcoord;
out vec4 frag_shaded;
void main()
{
    frag_shaded = ndotl * texture(myTexture, frag_texcoord);
}
```

pass texture coordinate on to fragment shader

diffuse shading with texture for directional light

vertex shader

fragment shader

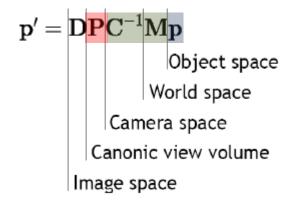

```
uniform sampler2D myTexture;
in float ndotl;
in vec2 frag_texcoord;
out vec4 frag_shaded;
void main()
{
    frag_shaded = ndotl * texture(myTexture, frag_texcoord);
}
```

predefined output variable gl_Position
The vertexshader must always assign a value to this!

diffuse shading with texture for directional light

vertex shader

```
uniform sampler2D myTexture;
in float ndotl;
in vec2 frag_texcoord;
out vec4 frag_shaded;
void main()
{
    frag_shaded = ndotl * texture(myTexture, frag_texcoord);
}
```

diffuse shading with texture for directional light

vertex shader

```
uniform sampler2D myTexture;
in float ndotl;
in vec2 frag_texcoord;
out vec4 frag_shaded;
void main()
{
    frag_shaded = ndotl * texture(myTexture, frag_texcoord);
}
```

diffuse shading with texture for directional light

vertex shader

fragment shader

```
uniform sampler2D myTexture;
in float ndotl;
in vec2 frag_texcoord;
out vec4 frag_shaded;
void main()
{
    frag_shaded = ndotl * texture(myTexture, frag_texcoord);
}
```

texture(sampler2D, vec2)

= predefined function for texture-fetches.

argument 1: texture identifier

argument 2: (u,v) - texture coordinates

(normalized to range [0,1])

Return value is of type vec4

Functions

- You can write functions as you would in C or in Java with public static
- They can have **out** and **inout** arguments, which behave like references (to objects)
- This allows for multiple return values.

- How do we set up the uniform variables?
- How about the in per vertex attributes for the vertex shader?
 - This is being done for you in jrtr, check out what happens with the SEMANTICS that you pass when creating VertexData objects.
 - Not covered here.

Uniforms:

glUniform* binds uniform data to names in shader

Each datatype has his own **glUniform***-function:

glUniform(1|2|3|4)(f|i):

(1|2|3|4): dimension of type (f|i): type (float or int)

Example:

```
int id = gl.glGetUniformLocation(activeShader.programId(), "lightDirection");
gl.glUniform4f(id, 0, 0, 1, 0);
```

"gl." is not part of the name of this function (in official OpenGL documentations), but this is what you get for wrapping a procedural interface in an OO language...

Example:

```
Returns identifier for a specific uniform variable in a specific shader
```

```
int id = gl.glGetUniformLocation(activeShader.programId(), "lightDirection");
gl.glUniform4f(id, 0, 0, 1, 0);
```

Example:

Identifier is required to let glUniform know to which variable a value should be bound

```
int id = gl.glGetUmiformLocation(activeShader.programId(), "lightDirection");
gl.glUniform4f(id, 0, 0, 1, 0);
```

Example:

Type of univorm variable in shader Here its **vec4**

```
int id = gl.glGetUniformLocation(activeShader.programId(), "lightDirection");
gl.glUniform4f(id, 0, 0, 1, 0);
```

Example:

Data that should be passed. List of arguments depends on type. Here, for vec4, we need 4 values

```
int id = gl.glGetUniformLocation(activeShader.programId(), "lightDirection");
gl.glUniform4f(id, 0, 0, 1, 0);
```

Arrays are passed with *glUniform*v* (more on this later...)

Matrices are passed with glUniformMatrix*v

For more detail refer to:

https://www.opengl.org/sdk/docs/man/html/glUniform.xhtml

Write some interesting per-vertex and per-pixel programs aka. Shaders in GLSL.

Together with the Java-side code needed to pass data to them.

Preparation:

- Study how jrtr manages «materials» and «light sources» (refer to assignment description):
 - SceneManager stores lightsources in a list
 - Shapes have a reference to a material
 - Materials have a reference to the shaders they use
 - glRenderContext sets up a material for rendering by activating its shader and passing on uniform variables

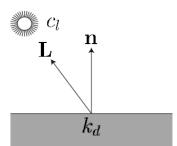

Note that OpenGL knows nothing about 'materials' and 'light sources' (this used to be different).

- 1. Create a diffuse shader for multiple point lights:
 - Point lights have a radiance c_l and a position p.
 - Objects have a diffuse reflection coefficient k_d

Uniforms!

Diffuse shading of an object with several point lights is:

$$\sum_{i} c_{l_i} k_d (n \cdot L_i)$$

- 1. Create a diffuse shader for multiple point lights:
 - Uniforms of the point lights can be passed as array
 - But: Size of arrays must be known to GLSL at compile time!
 - Therefore its okay if the maximum number of lights is fixed (as long as its >1 ©)

```
#define MAX_LIGHTS 8
uniform vec3 light_color[MAX_LIGHTS];
```

- 1. Create a diffuse shader for multiple point lights:
 - To pass arrays we need to use glUniform*v

Example:

```
int numOfElements = 3;
float[] dataArray = {1,2,3,4,5,5};
int offset = 0;
gl.glUniform2fv(id, numOfElements, dataArray, offset);
```

Then the uniform-array in the shader has the values

```
{ vec2(1,2), vec2(3,4), vec2(5,5) }
```

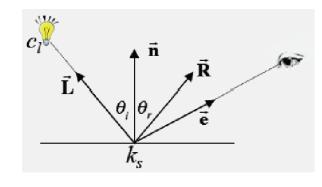

2. Per-pixel Phong shading for several point lights:

• Objects have an additional specular reflection coefficient k_s and a Phong-exponent p.

=> more Uniforms!

We need to calculate:

$$\sum_{i} c_{l_i} \left(k_d (n \cdot L_i) + k_s (R \cdot e)^p \right)$$

- R can be computed using the predefined function reflect
- For computing **e** its useful to pass the camera position as uniform variable, because $e = camera_{pos} surface_{pos}$

3. Texturing:

- Copy & modify shader from exercise 2 to support textures!
 - Meaning k_d becomes the color that is fetched from the texture
- Further, copy & extend the shader to support a gloss map:

3. Texturing:

• Gloss map:

An additional texture whose brightness (sum of R,B and G) is used to control the specular coefficient k_s.

You can also use the alpha channel of an existing texture or so...

Assigmnent

4. Experiment with shaders:

Create your own shader, that can do whatever you want ©

Assigmnent

4. Experiment with shaders:

You can use code from the internet if you want!

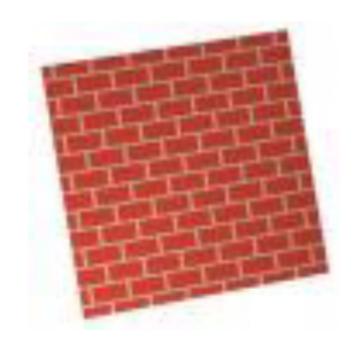

(but you probably need to modify it to work with jrtr...)

...but feel free to do your own stuff!

Toonshader

Procedural Brick Shader

Procedural Stripe Shader

Procedural Noise Shader

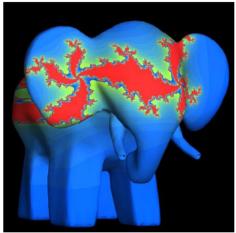

(if you dare...)

Julia Set

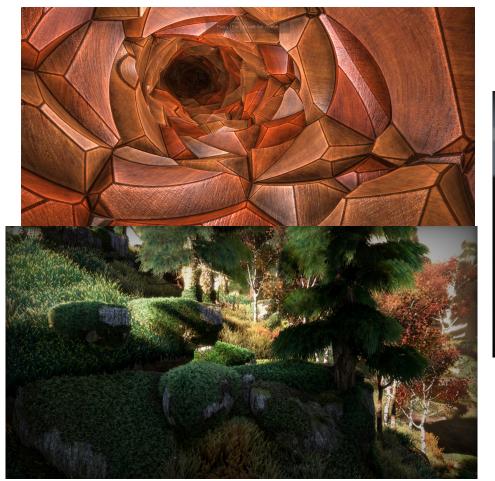

Toy Ball

Discarding Fragments

Many more on ShaderToy (this is an art form!)

Remarks

Get some tools for GLSL authoring (at least syntax highlighting).

There is probably some plug in for your IDE.

Some GLSL features might be version-, platform-, graphics card- & driver- etc. – specific, watch out.
