Phase Shifts

The Gibbs sampling algorithm may easily converge on a local optimum that is a “phase-shifted” version of the global optimum. Why?

Optimal solution:

Solution found:

SQKETGDILGISQMHVSR**LQ**RKAVKKL
TQREIA**KELGISRSYVSR**IEKRALMKM
RVSITA**ENLGLTQPAVSN**ALKRLRTSL
CFVRAA**FEAGIGLGALAR**LCRALDAAN
RRIEIA**HALCLTERQIKI**WFQNRMKW

TQR**SLAKALKISHVSVS**QWERGDSEPT
EKE**EVAKKCGITPLQVRV**WFINKRMRS
GTE**KTAEAVGVDKSQIS**RWKRDWIPKF

One remedy is to add a separate “phase-shift sampling step”.

No segments are removed, but likelihoods are calculated for the current alignment and several phase-shifted alternatives.

This can be understood as changing the topology, of definition of distance, on the underlying “alignment space.”
